

Second midterm test: hybrid test with MyLabs Plus

- The test will take place in Therm.
- The test will consist of two parts: a written exam, and a digital test, using Chromebooks.
- You are not allowed to leave Therm before 9:15 (even when you are ready early).
- Be there well in time. If you use public transportation, take one bus or train earlier than usual.
 Although use a start late (but not laten then 0.15) this should be

Although you can start late (but not later than 9:15), this should be an exception. Be well aware that you will disturb your fellow students that already started their test.

You have maximal 30 minutes to complete the digital test (40 minutes for dislectic students).

Second midterm test: hybrid test with MyLabs Plus

Introduction to Mathematics and Modeling

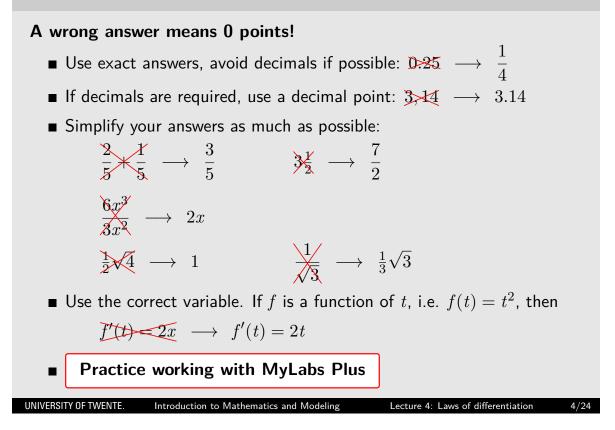

- You can start the digital test between 8:45 and 9:15, but the test shuts down at 9:45 (9:55 for dislectic students). This means that if you start the digital test after 9:15, you will not have the full 30/40 minutes at your disposal!
- The written exam starts at 8:45, and stops at 9:45 (9:55 for dislectic students).
- The use of an electronic calculator (or any other device) is not allowed. A calculator will be available on the chromebook as a separate app.
- For the second midterm test, a trigonometry formula sheet will not be issued.
- A practice tests (both digital and hand-written) will be published on Canvas.
- You can review the digital test no sooner than 12:00.

Differentiating powers

The derivative of $f(x)=x^{\alpha}$

Let α be a real number and let $f(x) = x^{\alpha}$ then

$$f'(x) = \alpha x^{\alpha - 1}$$

Examples:

$$\begin{aligned} f(x) &= 1 = x^0 \quad \Longrightarrow \quad f'(x) = 0.x^{-1} = 0 \\ f(x) &= x = x^1 \quad \Longrightarrow \quad f'(x) = 1x^0 = 1 \\ f(x) &= \sqrt{x} = x^{\frac{1}{2}} \quad \Longrightarrow \quad f'(x) = \frac{1}{2}x^{-\frac{1}{2}} = \frac{1}{2\sqrt{x}} \\ f(x) &= \frac{1}{x} = x^{-1} \quad \Longrightarrow \quad f'(x) = (-1)x^{-2} = -\frac{1}{x^2} \end{aligned}$$

Constant multiplication

Rule of constant mutiplication

Let c be a constant, then

$$\frac{d}{dx}(cf(x)) = cf'(x).$$

Examples

$$\frac{d}{dx}(2x^4) =$$

$$\frac{d}{dx}(2x)^4 =$$

$$\qquad \qquad \frac{d}{dx}\sqrt{3x} =$$

🚸 recap

Adding and subtracting

Sum rule

For all functions f and g we have

$$\frac{d}{dx}(f(x) + g(x)) = f'(x) + g'(x).$$

Difference rule

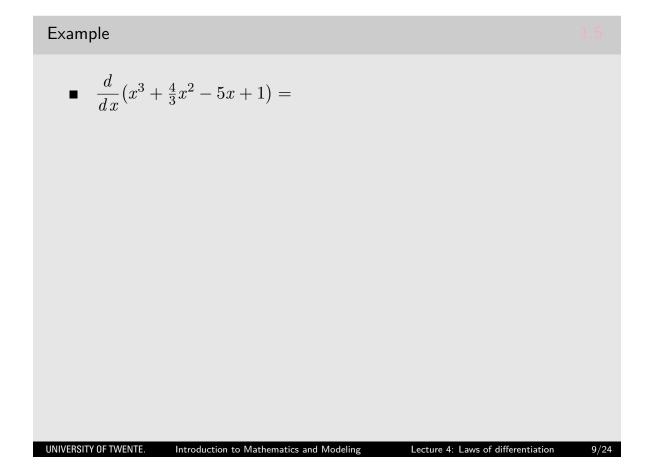

UNIVERSITY OF TWENTE.

For all functions f and g we have

$$\frac{d}{dx}\Big(f(x) - g(x)\Big) = f'(x) - g'(x).$$

Introduction to Mathematics and Modeling

Lecture 4: Laws of differentiation

The product rule

Theorem

If f and g are differentiable at x then

$$\frac{d}{dx}\Big(f(x)g(x)\Big) = f'(x)g(x) + f(x)g'(x).$$

Example: differentiate (x + 1)(x - 1).

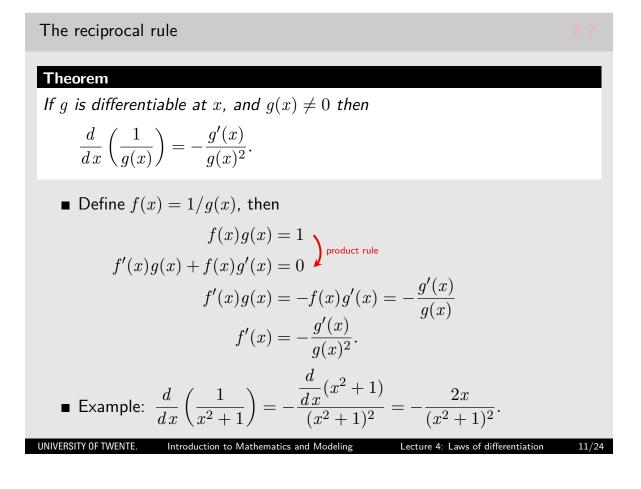

Apply the product rule:

$$\frac{d}{dx}(x+1)(x-1) =$$

■ Alternatively, expand (x + 1)(x - 1) = then differentiate:

The quotient rule

Theorem

If f and g are differentiable at x, and $g(x) \neq 0$, then

Introduction to Mathematics and Modeling

$$\frac{d}{dx}\left(\frac{f(x)}{g(x)}\right) = \frac{f'(x)g(x) - f(x)g'(x)}{g(x)^2}.$$

- The quotient rule can be proven with the reciprocal rule and the product rule (see self-tuition exercises).
- Example:

Lecture 4: Laws of differentiation

The derivative of exponential functions

• Let
$$f(x) = a^x$$
, then
 $k_a = f'(0)$
 $= \lim_{h \to 0} \frac{f(0+h) - f(0)}{h} = \lim_{h \to 0} \frac{a^h - a^0}{h} = \lim_{h \to 0} \frac{a^h - 1}{h}$

• For arbitrary x we have

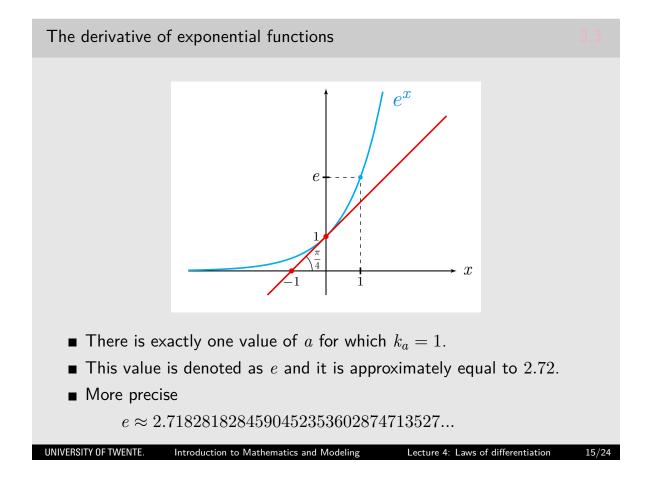

$$f'(x) = \lim_{h \to 0} \frac{a^{x+h} - a^x}{h}$$
$$= \lim_{h \to 0} \frac{a^x a^h - a^x}{h}$$
$$= \lim_{h \to 0} \frac{a^h - 1}{h} a^x = k_a a^x = k_a f(x).$$

■ The derivative of an exponential function is *proportional* to the function.

The derivative of exponential functions

- The function e^x is called the **(natural) exponential function**.
- It has the elegant property

$$\frac{d}{dx}\left(e^{x}\right) = e^{x}$$

The exponential function is it's own derivative!

• The number *e* is used as the base for the **natural logarithm**:

$$\ln(x) = \log_e(x).$$

• For the number k_a the following holds:

$$k_a = \ln a.$$

To prove this you need the chain rule (next lecture).

$$\frac{d}{dx}\left(a^{x}\right) = \ln a \cdot a^{x}$$
