

Design Science Methodology MIKS

Winter 2016 – 2017

Prof. Dr. Roel Wieringa

MIKS 17 January 2017

© R.J. Wieringa

1

0. Introduction

MIKS 17 January 2017

© R.J. Wieringa

2

0.1 Goal of the course

MIKS 17 January 2017

© R.J. Wieringa

3

Goal of the course

- Help you do your research projects (e.g. Master thesis)
 - Improve your capability to **justify** your solution
 - Help you **structure** your Master's thesis
- Improves your problem-solving capability
 - But not a creativity course

MIKS 17 January 2017

© R.J. Wieringa

4

Reality check

What kind of problems?

- Business Information Technology master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60025.html>
- Computer Science master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60300.html>
- Business Administration master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60644.html>
- Master theses in human-media interaction
 - <http://essay.utwente.nl/view/programme/60030.html>

MIKS 17 January 2017

© R.J. Wieringa

5

Two kinds of research problems

- (1) Design problems
 - *Improve something, design something, how-to-do something*
 - Problem, design of a treatment, validation of the treatment
 - **Design cycle**
 - Improvement is the goal, utility is the criterion
 - Knowledge is a side-effect
 - "Technical research problems"
- (2) Knowledge questions
 - *Describe, explain, predict*
 - Questions, research design, research execution, data, analysis
 - **Empirical research cycle**
 - Knowledge is the goal, truth is the criterion
 - Utility is a side-effect

MIKS 17 January 2017

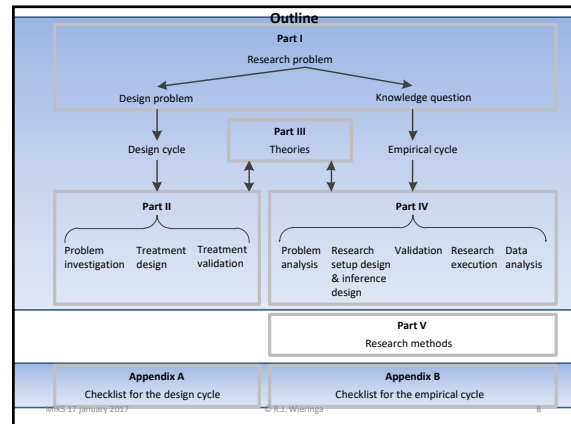

© R.J. Wieringa

6

Focus on justification

- This is not a creativity course
 - Not about how to be original
- The course is about how to **justify** and **report** your research results
 - Why would anyone use your design? There are many other designs.
 - Why would anyone believe your answers? Opinions are cheap.
- This also helps you to organize the project itself.

MIKS 17 January 2017 © R.J. Wieringa 7

0.2 Organization of the course

MIKS 17 January 2017 © R.J. Wieringa 9

Material

- Book <http://link.springer.com/book/10.1007/978-3-662-43839-8>
- Slides

Schedule

- Today
 - Course on design cycle
 - Questions and exercises during the day
- After today: Make outline the table of contents of your thesis
- 21st February
 - Present your table of contents on a poster
 - Course on empirical research design
 - Finalize poster

MIKS 17 January 2017 © R.J. Wieringa 10

Questions?

MIKS 17 January 2017 © R.J. Wieringa 11

1 What is design science?

MIKS 17 January 2017 © R.J. Wieringa 12

2.1 The subject of design science

MIKS 17 January 2017 © R.J. Wieringa 13

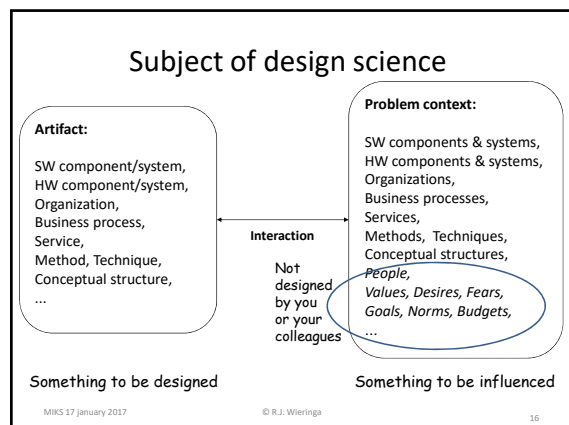

- Design science is the **design** and **investigation** of artifacts in context

MIKS 17 January 2017 © R.J. Wieringa 14

Reality check: What is the artifact and what is the context?

- Business Information Technology master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60025.html>
- Computer Science master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60300.html>
- Business Administration master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60644.html>
- Master theses in human-media interaction
 - <http://essay.utwente.nl/view/programme/60030.html>

MIKS 17 January 2017 © R.J. Wieringa 15

- Without a context, an artifact does nothing

MIKS 17 January 2017 © R.J. Wieringa 17

What is designed and what is given

- The problem context is given to you
 - It is not designed by you
 - May be designed by others
- The (renewed) artifact is (re)designed by you
 - It is not given to you
 - An older version of the artifact may be given to you

MIKS 17 January 2017 © R.J. Wieringa 18

Interaction should provide a service for the context

- The artifact interacts with the problem context ... in order to improve the context
- The interaction provides a **service** to the problem context

MIKS 17 January 2017 © R.J. Wieringa 19

2.2 Research problems in design science

MIKS 17 January 2017 © R.J. Wieringa 20

Research problems in design science

To design an artifact to improve a problem context

Problems & Artifacts to investigate

Knowledge, Design problems

To answer knowledge questions about the artifact in context

<p><i>Design software to estimate Direction of Arrival of plane waves, to be used in satellite TV receivers in cars</i></p> <p><i>Design a Multi-Agent Route Planning system to be used for aircraft taxi route planning</i></p> <p><i>Design a data location regulation auditing method</i></p> <p>Artifact of a design problem = the artifact to be designed</p>	<ul style="list-style-type: none"> • <i>Is the DoA estimation accurate enough in this context?</i> • <i>Is it fast enough?</i> • <i>Is this routing algorithm deadlock-free on airports?</i> • <i>How much delay does it produce?</i> • <i>Is the method usable and useful for consultants?</i> <p>Artifact of a knowledge question = the artifact about which we ask the knowledge question</p>
--	---

MIKS 17 January 2017 © R.J. Wieringa 21

Heuristics

- Design problems
 - ✓ Call for a change of the world
 - ✓ Solution is design
 - ✓ Many solutions
 - ✓ Evaluated by utility
 - ✓ Many degrees of utility
 - ✓ What is useful depends on stakeholder goals

- Knowledge questions
 - ✓ Ask for knowledge about the world
 - ✓ Answer is a proposition
 - ✓ One answer
 - ✓ Evaluated by truth
 - ✓ Many degrees of certainty about the answer
 - ✓ What is considered "true" does not depend on stakeholder goals

<http://www.factcheck.o>

Doing

Thinking

MIKS 17 January 2017 © R.J. Wieringa 22

Reality check: What is the artifact and what is the context?

- Business Information Technology master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60025.html>
- Computer Science master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60300.html>
- Business Administration master thesis at the University of Twente:
 - <http://essay.utwente.nl/view/programme/60644.html>
- Master theses in human-media interaction
 - <http://essay.utwente.nl/view/programme/60030.html>

MIKS 17 January 2017 © R.J. Wieringa 23

Conclusions

- The title of your thesis is the shortest summary of your research project.
 - The best titles mention the artifact and the context.
- The top-level research problem of a thesis is either a design problem or a knowledge question
 - The motivation of the research may be both curiosity/fun, as well as utility

MIKS 17 January 2017 © R.J. Wieringa 24

Exercise: Ingredients for your thesis title

- What research problem(s) are you investigating?
 - Artifact and context

MIKS 17 January 2017 © R.J. Wieringa 25

2.3 The social context of a design science project

MIKS 17 January 2017 © R.J. Wieringa 26

The social context of design research

Social context design research project:
Location of stakeholders

Goals, budgets ↓ ↑ Designs

Design science

Improvement design

Answering knowledge questions

*“Design a DoA estimation system to be used in cars”:
Stakeholders: Researchers, NXP (sponsor), component suppliers, car manufacturers, garages, car passengers*

*“Design an assurance method for cloud service provider data compliance”:
Stakeholders: KPMG (sponsor), KPMG consultants (end-users), researchers, CSPs, CPS clients.*

MIKS 17 January 2017 © R.J. Wieringa 27

2.4 The knowledge context of a design science project

MIKS 17 January 2017 © R.J. Wieringa 28

The context of design research

Social context:
Location of stakeholders

Goals, budgets ↓ ↑ Designs

Design science

Improvement design

Answering knowledge questions

Existing problem-solving knowledge,
Old designs

New problem-solving knowledge,
New designs

Existing answers to knowledge questions

New answers to knowledge questions

Knowledge context:
Mathematics, social science, natural science, design science, design specifications, useful facts, practical knowledge, common sense, other beliefs

MIKS 17 January 2017 © R.J. Wieringa 29

Knowledge sources

- Scientific literature
 - Scientific, peer reviewed journals and conferences (math, natural science, social science, design sciences)
- Technical literature
 - Design specifications, manuals
- Professional literature
 - Non-peer reviewed professional magazines, trade press, marketing literature, white papers (useful facts and opinions, practical knowledge, common sense)
- Oral communication
 - Colleagues, supervisors, practitioners (useful facts and opinions, practical knowledge, common sense, other beliefs)

MIKS 17 January 2017 © R.J. Wieringa 30

What about the Web?

- The Web is a communication channel, not a source of information
- Sources are more diverse
 - Scientific literature
 - Technical literature
 - Professional literature
 - On-line databases
 - Social networks
- Did the information survive
 - Empirical tests? → Fact check
 - Critical judgment of peers? → Logic check

MIKS 17 January 2017
© R.J. Wieringa
31

Your research aims at theories

- Knowing the relevant properties of a particular artifact in a particular context is not enough
 - Theories should be general, so you can use them for prediction
 - Theories should explain, so that you understand why phenomena occur
- If the artifact prototype that you built disappears, what is the knowledge remains?
 - Tested, critiqued knowledge

MIKS 17 January 2017
© R.J. Wieringa
32

Sciences of the middle range

MIKS 17 January 2017
© R.J. Wieringa
33

- Useful idealizations in software engineering and information systems
 - All clocks are synchronized and correct
 - Synchronicity of response and stimulus
 - Unlimited memory (Turing machines)
 - Message arrival guarantees
 - Rational users
 - Organizations with a clearly defined structure
 - ...
- Conditions of practice
 - Incorrect input
 - Messages get lost
 - Timeouts are discovered too late
 - Clocks drift
 - Users do not behave according to expectations
 - ...

MIKS 17 January 2017
© R.J. Wieringa
34

Scaling up

MIKS 17 January 2017
© R.J. Wieringa
35

Main points chapter 1 What is design science

- Design science is the **design and investigation of artifacts in context**
 - Research problems are **design problems** or **knowledge questions**
 - Artifacts **interact** with their context to deliver a **service**
- The **social context** of a design science project consists a.o. of stakeholders and their goals and budgets, laws, processes, norms, expectations, etc.
- The **knowledge context** consists of scientific knowledge, design specifications, useful facts, practical knowledge, common sense, etc. You aim to contribute scientific theories.
 - Sources and channels of information
- The design sciences are **middle-range sciences** aiming for partial generalizations about realistic conditions.
 - Need to scale up from idealized to practical conditions
 - Universal generalizations make unrealistic assumptions

MIKS 17 January 2017
© R.J. Wieringa
36

Exercise: Material for your elevator pitch

1. What design(s) will be delivered by your project?
 - What is new?
2. Who are the stakeholders of your project?
 - What are their goals?
3. What knowledge will be produced by your project?
 - What is new?

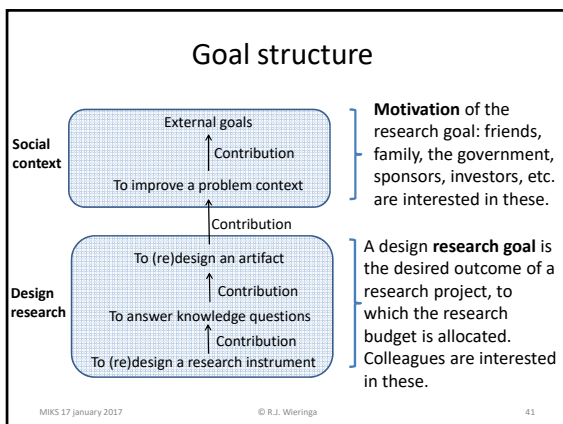

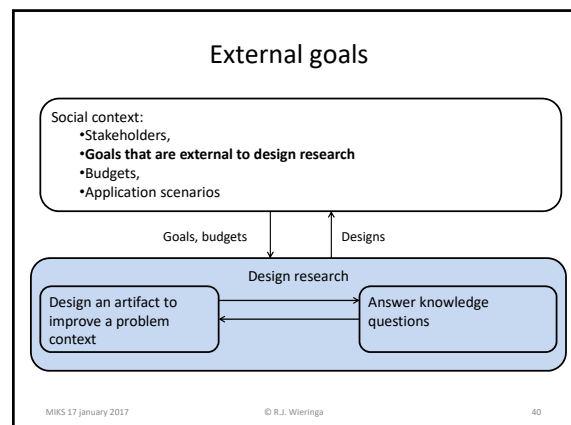

MIKS 17 January 2017 © R.J. Wieringa 37

2. Research Goals and Research Questions

MIKS 17 January 2017 © R.J. Wieringa 38

2.1 Research goals

MIKS 17 January 2017 © R.J. Wieringa 39

Examples

Ucare

- **External goals:**
 - Reduce health care cost (government)
 - Reduce work pressure, increase quality of care (health personnel)
 - Increase quality of care, increase independence (elderly)
- **Design goals**
 - Design a mobile home care system for use by elderly that provides
 - Medicine dispensing
 - Blood pressure monitoring
 - Agenda
 - Remote medical advice

MIKS 17 January 2017 © R.J. Wieringa 42

Two kinds of design research problems

- To achieve the design goal, we need to answer research questions.
 - Design problems
 - A.k.a. technical research questions
 - Knowledge questions
 - Analytical research questions: can be answered by analysis
 - Empirical research questions: must be answered by collecting data

MIKS 17 January 2017 © R.J. Wieringa 43

2.2 Design problems

MIKS 17 January 2017 © R.J. Wieringa 44

Template for design problems

- Improve <problem context>
- by <treating it with a (re)designed artifact>
- such that <artifact requirements>
- in order to <stakeholder goals>

- *Improve my body / mind health*
- *by taking a medicine*
- *such that my headache disappears*
- *in order for me to get back to work*

MIKS 17 January 2017 © R.J. Wieringa 45

Template for design problems

- Improve <problem context>
- by <treating it with a (re)designed artifact>
- such that <artifact requirements>
- in order to <stakeholder goals>

- *Improve my body / mind health*
- *by taking a medicine*
- *such that my headache disappears*
- *in order for me to get back to work*

External: Problem context and stakeholder goals

MIKS 17 January 2017 © R.J. Wieringa 46

Template for design problems

- Improve <problem context>
- by <treating it with a (re)designed artifact>
- such that <artifact requirements>
- in order to <stakeholder goals>

- *Improve my body / mind health*
- *by taking a medicine*
- *such that my headache disappears*
- *in order for me to get back to work*

Design research problem: Artifact and its desired interactions

MIKS 17 January 2017 © R.J. Wieringa 47

Template for design problems

- Improve <problem context>
- by <treating it with a (re)designed artifact>
- such that <artifact requirements>
- in order to <stakeholder goals>

- *Improve my body / mind health*
- *by taking a medicine*
- *such that my headache disappears*
- *in order for me to get back to work*
- *Improve home care*
- *By a mobile support device*
- *That provides some services ...*
- *So that cost are reduced etc.*

Particular problem **General problem**

MIKS 17 January 2017 © R.J. Wieringa 48

2.3 Knowledge questions

MIKS 17 January 2017 © R.J. Wieringa 49

Kinds of empirical knowledge questions

- Empirical knowledge questions may be
 - descriptive or explanatory,
 - open or closed,
 - effect-related or requirement-related

MIKS 17 January 2017 © R.J. Wieringa 50

Knowledge questions

- **Descriptive questions:**
 - What happened?
 - When?
 - Where?
 - What components were involved?
 - Who was involved?
 - etc.
- **Explanatory questions:**
 - Why?
 1. What has **caused** the phenomena?
 2. Which **mechanisms** produced the phenomena?
 3. For what **reasons** did people do this?

} Journalistic questions, Provide facts

MIKS 17 January 2017 © R.J. Wieringa 51

Example

- *Descriptive question: What is the performance of the Ucare system?*
 - Accuracy of output
 - Reliability of communication infrastructure
 - Usability of interfaces
 - Etc. etc.
- *Explanatory question: Why does Ucare have this performance?*
 1. **Cause:** data entrance at 03:00 causes the data to be lost
 2. **Mechanism:** because the hospital database server is down for maintenance at night and there is no fallback retention mechanism
 3. **Reasons:** Users feel free to enter data any time they are awake, and they are awake at 03:00.

MIKS 17 January 2017 © R.J. Wieringa 52

Prediction problems

- There are no predictive knowledge **questions**
 - We cannot know the future
 - Descriptive and explanatory **questions** are about the present and the past
- But there are prediction **problems**
 - How will the program behave when given this input?
 - How would users behave when the program is changed?
- To solve a prediction problem, we need a general theory that tells us what happens

MIKS 17 January 2017 © R.J. Wieringa 53

Second classification of knowledge questions

- **Open questions (exploration):**
 - No hypothesis about the answers.
 - What is the execution time?
- **Closed questions (testing):**
 - Specific, testable hypotheses as possible answers.
 - Is execution time less than 1 second?
 - Hypothesis: the execution time is less than 1 second.

MIKS 17 January 2017 © R.J. Wieringa 54

Third classification: Design research questions

- **Effect question:** Context X Artifact → Which Effects?
 - **Trade-off question:** Context X *Alternative artifact* → Effects?
 - **Sensitivity question:** *Other context* X artifact → Effects?
- **Requirements satisfaction question:** Do these Effects satisfy requirements sufficiently?

MIKS 17 January 2017

© R.J. Wieringa

55

Example

- **Open descriptive effect questions:** *What is the performance of the Ucare system?*
 - Accuracy of output
 - Reliability of communication infrastructure
 - Usability of interfaces
 - Etc. etc.
- **Open descriptive trade-off questions**
 - *What happens to the performance if we change the design?*
- **Open descriptive sensitivity questions:**
 - *What happens if it is used by other elderly, in other homes?*
- **Open explanatory questions:**
 - *Why does Ucare have this performance?*
- **Open descriptive requirements satisfaction questions:**
 - *Does this satisfy our requirements?*

MIKS 17 January 2017

© R.J. Wieringa

56

Main points chapter 2 Research goals & questions

- A design science projects has goals that range from designing an instrument (lowest level) to contribution to external stakeholder goals (highest level).
- Design problems have the form
 - Improve <problem context> by <treating it with a (re)designed artifact> such that <artifact requirements> in order to <stakeholder goals>
- Knowledge questions may be analytical or empirical.
 - Empirical knowledge questions may be
 - descriptive or explanatory,
 - open or closed,
 - effect-related or requirement-related
- To answer prediction problems, we need general theories

MIKS 17 January 2017

© R.J. Wieringa

57

Questions about chapter 2?

MIKS 17 January 2017

© R.J. Wieringa

58

Exercise: your top-level design problem

- What is/are your top-level design problem(s), using our template?
 - Improve <problem context>
 - by <treating it with a (re)designed artifact>
 - such that <artifact requirements>
 - in order to <stakeholder goals>
- For a knowledge-oriented thesis, think of a top-level design problem that motivates your knowledge question

MIKS 17 January 2017

© R.J. Wieringa

59

Research questions

- Research questions form a hierarchy
 - Some questions are knowledge questions, others are design problems
 - All are subproblems of the top-level research problem
- Business Information Technology master thesis at the University of Twente: <http://essay.utwente.nl/view/programme/60025.html>
- Computer Science master thesis at the University of Twente: <http://essay.utwente.nl/view/programme/60300.html>
- Business Administration master thesis at the University of Twente: <http://essay.utwente.nl/view/programme/60644.html>
- Master theses in human-media interaction <http://essay.utwente.nl/view/programme/60030.html>

MIKS 17 January 2017

© R.J. Wieringa

60

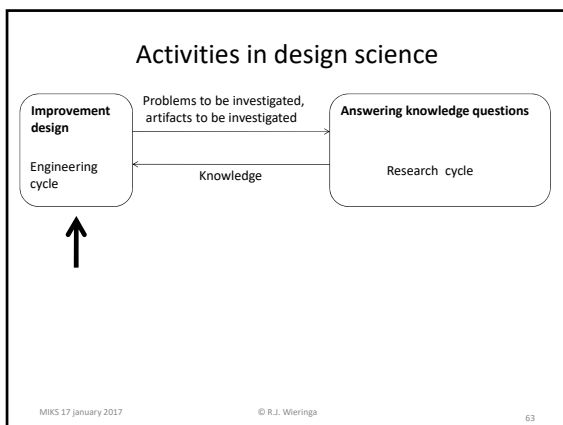

Exercise: your research questions

- Formulate the subproblems of your top-level research problem

MIKS 17 January 2017 © R.J. Wieringa 61

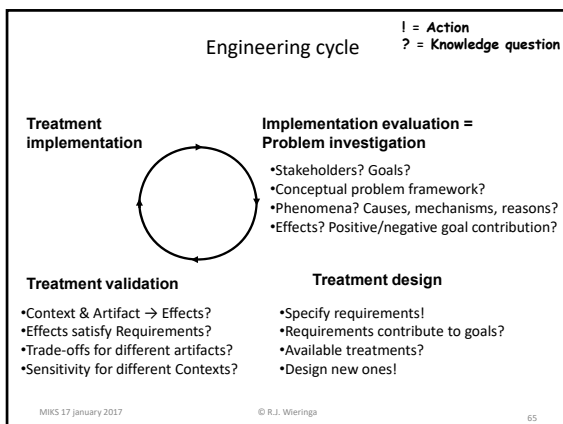

3 The design cycle

MIKS 17 January 2017 © R.J. Wieringa 62

3.1 The design and engineering cycles

MIKS 17 January 2017 © R.J. Wieringa 64

Treatment

- We avoid the word “solution”.
 - Every solution is imperfect
 - ... and introduces new problems

MIKS 17 January 2017 © R.J. Wieringa 66

Specification and design

- Treatments are designed, and the design is specified
- **Designing** is deciding what to do
- **Specifying** is documenting that decision
- Contrast with the terminology in software engineering
 - Word games with “what” and “how”.

MIKS 17 January 2017 © R.J. Wieringa 67

What is implementation?

- Depends on who you talk to
 - For a software engineer, this is writing and debugging a program until it works.
 - For a mechanical engineer, this is assembling the physical machine until it works
 - For the manager, this is introducing the machine in the organization until it works
 - For a marketer, this is selling the system

MIKS 17 January 2017 © R.J. Wieringa 68

Implementation

- **Implementation** = introducing an artifact in the intended problem context
 - What this means depends on what your problem was
 - For a software engineer: To construct software
 - For a mechanical engineer: To construct physical machine
 - For the manager: To change an organization
 - For a marketer: To sell a product
- In this course, our problems are real-world problems
 - Implementation = transfer to the problem context
 - = technology transfer to the real world

MIKS 17 January 2017 © R.J. Wieringa 69

Design cycle

Real-world implementation evaluation = Real-world problem investigation

- Stakeholders? Goals?
- Conceptual problem framework?
- Phenomena? Causes, mechanisms, reasons?
- Effects? Positive/negative goal contribution?

Treatment design

- Specify requirements!
- Requirements contribute to goals?
- Available treatments?
- Design new ones!

Treatment validation

- Context & Artifact → Effects?
- Effects satisfy Requirements?
- Trade-offs for different artifacts?
- Sensitivity for different Contexts?

Technology transfer

MIKS 17 January 2017 © R.J. Wieringa 70

Nesting of cycles

BIT M.Sc. project	Real-world problem investigation	
	Treatment design	
	Treatment validation	Problem investigation: what to test?
		Treatment design (design a prototype)
		Implementation (prototype construction)
		Evaluation (in the laboratory or field)
	Implementation (tech transfer)	
	Implementation evaluation (in the field)	

This is a very special engineering cycle. Later we will call this the empirical cycle. It is performed to answer empirical knowledge questions

MIKS 17 January 2017 © R.J. Wieringa 71

Validation versus evaluation

- To **validate** a design for stakeholders is to justify that it would contribute to their goals **before** transfer to practice
 - Predicted effects?
 - Satisfaction of requirements?
 - (Requirements contribute to goals?)
- To **evaluate** an implementation is to investigate whether an implementation has contributed to stakeholder goals **after** transfer to practice
 - Stakeholders, goals?
 - Effects?
 - Contribution?

MIKS 17 January 2017 © R.J. Wieringa 72

What is the difference?

- **Implementation valuation** research studies real-world implementations with respect to actual stakeholder goals
 - Real-world research
- **Treatment validation** research uses a validation model to predict effects
 - Simulation

MIKS 17 January 2017 © R.J. Wieringa 73

What kind of project do you have?

- Some projects do **implementation evaluation**
 - E.g. investigate how UML is used in practice
 - Investigate traffic flow on internet
 - Investigate why our project effort estimations are always so wrong
- Many projects **design and validate treatments**
 - E.g. improve malware detection methods to get higher accuracy
 - Explore the use of social networks to communicate with our customers

This determines the kind of research questions that you can ask

MIKS 17 January 2017 © R.J. Wieringa 74

3.2 Design and engineering processes

MIKS 17 January 2017 © R.J. Wieringa 75

- The design and engineering cycles are **rational reconstructions** of design and engineering
 - Rational reconstruction of mathematical proofs
 - Of empirical research
 - Of administrative processes
- The design and engineering **processes** execute tasks in different orders
 - Resources (time, money, people) must be managed
 - Deliverables must be scheduled, deadlines must be met

MIKS 17 January 2017 © R.J. Wieringa 76

Concurrent engineering

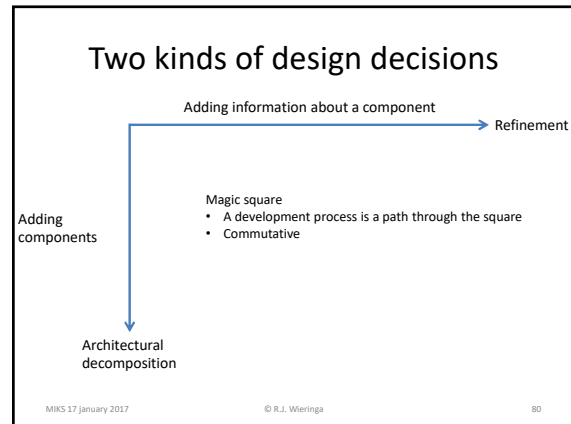

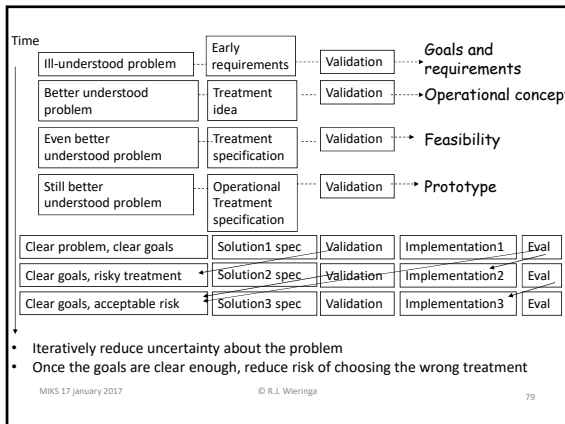

- Development may be organized concurrently with successive versions of the artifact

MIKS 17 January 2017 © R.J. Wieringa 77

Systems engineering

- Cycles of systems engineering
 - High level goals, high level requirements
 - Iterative refinement until
 - Low-level approved interfaces, low-level implemented specs.
- Shown on next slide

MIKS 17 January 2017 © R.J. Wieringa 78

Engineering management

- Management is the art of achieving results by the work of others.
 - Acquiring resources
 - Organizing them
 - Planning work
 - Managing risks
 - Motivating people
 - Evaluating outcomes

Systems engineering is a particular way to plan work & manage risks

MIKS 17 January 2017 © R.J. Wieringa 81

Main points chapter 3

The design cycle

- The engineering cycle is a rational decision cycle:
 - Problem/evaluation: Look where you are and what you want to do;
 - Design possible treatments;
 - Validate treatments without executing them;
 - Choose one and implement it;
 - Evaluation/problem: Look where you are now and what you now want to do.
- The design cycle is the preparation for action:
 - Problem-design-validation.
- The cycles can be organized in many different ways.
 - All of them must allow you to justify your choices afterwards.
 - The engineering cycle allows you to justify your actions (validation) and to learn from their effects (evaluation)

MIKS 17 January 2017 © R.J. Wieringa 82

Questions about chapter 3?

MIKS 17 January 2017 © R.J. Wieringa 83

Exercise (design-driven thesis)

your table of contents

- Make a poster with the outline of the table of contents of your thesis, following this pattern:
 - Introduction: Societal improvement problem, stakeholders and their goals, current designs, gap with improvement needs.
 - Research problem: top-level design problem; decomposition into subproblems and knowledge questions
 - Research methodology
 - State of the art: existing designs
 - Requirements for a new design; motivation in terms of stakeholder goals; evaluation of current designs against the requirements
 - New design
 - Validation of new design: prototypes, simulations, field experiments, etc.
 - (More designs and validations)
 - Conclusions, recommendations, and further work

MIKS 17 January 2017 © R.J. Wieringa 84

Exercise (knowledge-driven thesis): your table of contents

- Make a poster with the outline of the table of contents of your thesis, following this pattern:
 - Introduction: Societal improvement problem, stakeholders and their goals, current knowledge, gap with desired knowledge.
 - Research problem: Top-level knowledge question; decomposition into sub-questions
 - State of the knowledge: existing knowledge
 - Research methodology
 - Study: observational study, experimental, case-based, sample-based, etc.
 - (More studies)
 - Conclusions, recommendations, and further work

MIKS 17 January 2017 © R.J. Wieringa 85

4. Stakeholder and Goal Analysis

MIKS 17 January 2017 © R.J. Wieringa 86

Engineering cycle

! = Action
? = Knowledge question

Treatment implementation

Implementation evaluation = Problem investigation

- Stakeholders? Goals?
- Conceptual problem framework?
- Phenomena? Causes, mechanisms, reasons?
- Effects? Positive/negative goal contribution?

Treatment design

- Specify requirements!
- Requirements contribute to goals?
- Available treatments?
- Design new ones!

Treatment validation

- Context & Artifact → Effects?
- Effects satisfy Requirements?
- Trade-offs for different artifacts?
- Sensitivity for different Contexts?

MIKS 17 January 2017 © R.J. Wieringa 87

4.1 Stakeholders

MIKS 17 January 2017 © R.J. Wieringa 88

Stakeholders

- A **stakeholder** of a problem is a biological or legal person affected by treating a problem.
 - People, organizations, job roles, contractual roles, etc.
- Typical stakeholders of a **design research project**
 - Researchers, sponsors, developers, users, etc.
 - They have an interest in the outcome.
- Typical stakeholders of a **development project**
 - Designers, programmers, testers, users etc.
- Typical stakeholders of a **software product**
 - See next slides

MIKS 17 January 2017 © R.J. Wieringa 89

P. Clements, L. Bass. "Using business goals to inform software architecture." *18th IEEE International Requirements Engineering Conference*. Pages 69-78. IEEE Computer Science Press. 2010.

- The organization may be a company, government organization, department, project, etc.

MIKS 17 January 2017 © R.J. Wieringa 90

Checklist by role (Ian Alexander <http://www.scenarioplus.org.uk/papers/papers.htm> > A taxonomy of stakeholders)

<p>System under Development</p> <ul style="list-style-type: none"> • Normal operator (end user) • Operational support • Maintenance operator <p>Immediate context</p> <ul style="list-style-type: none"> • Functional beneficiary (client) • Roles responsible for interfacing systems <p>Wider context</p> <ul style="list-style-type: none"> • Political beneficiary (who gains status) • Financial beneficiary 	<ul style="list-style-type: none"> • Negative stakeholder (who is/perceives to be hurt by the product) • Threat agent (who wants to hurt the product) • Regulator <p>Involved in development</p> <ul style="list-style-type: none"> • Champion/Sponsor • Developer • Consultant • Purchaser (customer) • Suppliers of components
---	---

None of these lists is complete

MIKS 17 January 2017 © R.J. Wieringa 91

Examples of stakeholders

- *PISA: Design a system to help individuals to maintain their privacy on the internet at a desired level*
 - Free lancer
 - Teleworker
 - Home banker
 - Concerned parent
- *Ucare: Design a system that provides health care support for elderly people at home*
 - Medicine taking
 - Blood pressure monitoring
 - Agenda
 - Remote advice
- We omit researcher goals henceforth

MIKS 17 January 2017 © R.J. Wieringa 92

4.2 Desires

MIKS 17 January 2017 © R.J. Wieringa 93

Stakeholder awareness and commitment

Not aware: Some possibility that stakeholders are not aware of

- Possibility to receive satellite TV in car
- Possibility to reduce taxing time

An event pushes the possibility into awareness

Aware, not committed: Resources committed (money, time)

Indifferences, Desires, Fears

- We could upgrade car DVD player to TV
- We could optimize taxi routes dynamically

Stakeholder makes resources (time, money) available

Aware & Committed: Resources committed to act for a **Goals**

- Invest in car satellite TV
- Develop a prototype multi-agent route planning system

MIKS 17 January 2017 © R.J. Wieringa 94

- A **goal** of a stakeholder is a desire to the realization of which the stakeholder has committed resources (time, money)
 - People want a lot but they have only a few goals
 - Some goals are imposed

MIKS 17 January 2017 © R.J. Wieringa 95

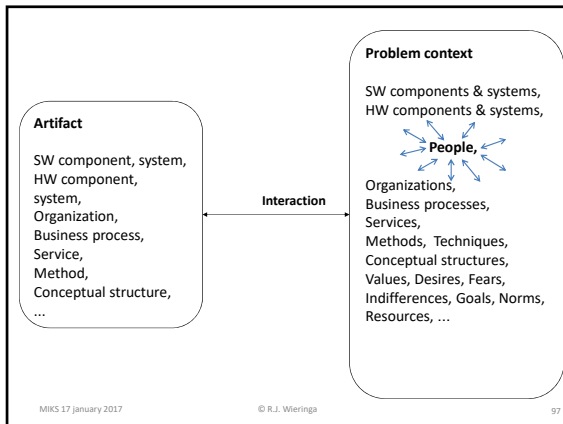

Anything can be the object of desire, fear or indifference

People attach positive, negative or zero value to ...

- Desires
- Fears
- Goals
- Norms
- Resources
- Values
- Conceptual structures
- Techniques
- Methods
- Business processes
- Services
- Organizations
- HW components, systems
- SW components, systems

- Desires, fears and indifference are mental states:
 - They can be **directed upon** anything, whether real or imaginary
 - Every mental state is **about** something
 - They can even be about desire, fear or indifference

MIKS 17 January 2017 © R.J. Wieringa 96

Examples of problem contexts

- *Ucare: Design a system that provides health care support for elderly people at home.*
 - Context: *Patient's home*
 - *Patient and their physical and technical context, budget, desires, norms and values*
 - *Friends and their budget, desires, norms and values*
 - *Family and their budget, desires, norms and values*
 - *Home care nurses and their budget, desires, norms and values*
 - *Remote medical personnel and their budget, desires, norms and values*
 - *The law*
 - *Ethical constraints*

MIKS 17 January 2017 © R.J. Wieringa 98

4.3 Desires and conflicts

MIKS 17 January 2017 © R.J. Wieringa 99

The multitude of desires

- Any one stakeholder may have infinitely many potential desires, fears and indifferences
- Many desires of one or more stakeholders may conflict

MIKS 17 January 2017 © R.J. Wieringa 100

Conflicting desires

- **Logical conflict:**
 - Analysis of the descriptions of the desires shows that both descriptions have opposite meaning; they are logically inconsistent.
 - *Spend your money and keep it*
- **Physical conflict:**
 - Realization of one desire makes realization of the other physically impossible.
 - *Eat more and stay the same weight*
 - *Add TV to a car and reduce weight without changing anything else*
 - Stakeholder lives in a phantasy world

MIKS 17 January 2017 © R.J. Wieringa 101

- **Technical conflict:**
 - There is currently no technology to realize both desires in the same artifact.
 - *Secure and user-friendly system*
 - New technology may remove the conflict
- **Economic conflict:**
 - Desires exceed the budget
- **Legal conflict:**
 - Desires contradict the law
- **Moral conflict:**
 - Desires contradict moral norms

MIKS 17 January 2017 © R.J. Wieringa 102

Examples of conflicting desires

- *Ucare: Design a system that provides health care support for elderly people at home*
 - *Technical conflict: Artifact should be simple to use, but is fragile & advanced technology.*
 - *Economic conflict: Artifact should be cheap, but is expensive*
 - *Value conflict: patient likes Skyping more than the advice functions*
- Conflicts give us relevant design goals.

MIKS 17 January 2017 © R.J. Wieringa 103

Discussing questions 4 of ch 2 and 1 of ch 3

- [..\Q&A\Questions and Assignments.pdf](#)

MIKS 17 January 2017 © R.J. Wieringa 104

Main points chapter 4 Stakeholder and goal analysis

- A **stakeholder** of a problem is a biological or legal person affected by treating a problem
 - Positively or negatively affected
 - There are checklists of possible stakeholders
- A **goal** of a stakeholder is a *desire* to the realization of which the stakeholder has *committed* resources (time, money)
 - Desires are many, goals are few
- Desires may **conflict** with each other
 - Therefore, goals of one or more stakeholders may conflict too.
 - Logical, physical, technical, economic, legal, moral conflict

MIKS 17 January 2017 © R.J. Wieringa 105

Exercise

- Make a list of stakeholders of your thesis project.
- What are the goals of each stakeholder?

MIKS 17 January 2017 © R.J. Wieringa 106

5 Implementation Evaluation and Problem Investigation

MIKS 17 January 2017 © R.J. Wieringa 107

Engineering cycle

! = Action
? = Knowledge question

Treatment implementation

Implementation evaluation = Problem investigation

- Stakeholders? Goals?
- Conceptual problem framework?
- Phenomena? Causes, mechanisms, reasons?
- Effects? Positive/negative goal contribution?

Treatment design

- Specify requirements!
- Requirements contribute to goals?
- Available treatments?
- Design new ones!

Treatment validation

- Context & Artifact → Effects?
- Effects satisfy Requirements?
- Trade-offs for different artifacts?
- Sensitivity for different Contexts?

MIKS 17 January 2017 © R.J. Wieringa 108

5.1 Research goals

MIKS 17 January 2017

© R.J. Wieringa

109

Two alternative top-level goals of real-world research

- **Implementation evaluation** is the investigation of the effects of a treatment implementation *after* the improvement has been implemented
- **Problem investigation** is the investigation of the problem context *before* an improvement is undertaken
- There is always a current implementation of *something!*
 - So the research questions are the same, only the goals are different.

MIKS 17 January 2017

© R.J. Wieringa

110

Examples

- **Implementation evaluation**
 - Investigate the use of the UML in companies in Brazil. Our goal is to find out the extent of usage.
 - Investigate the sources of phishing messages received by our organization. Our goal is to find out how bad it is.
- **Problem investigation**
 - Investigate the causes why our effort estimations are usually wrong. Our goal is to find improvement opportunities.
 - Investigate coordination problems in global software engineering projects. Our goal is to reduce these problems.

MIKS 17 January 2017

© R.J. Wieringa

111

Research questions for implementation evaluation & problem investigation

- **Effect questions**
 - Descriptive: What effects does the implemented artifact have?
 - Explanatory: Why do these effects arise? (causes, mechanisms, reasons)
- **Goal contribution questions**
 - Evaluative: Do they contribute to/detract from stakeholder goals? To which extent?
 - Explanatory: why does this happen? (causes, mechanisms, reasons)

MIKS 17 January 2017

© R.J. Wieringa

112

5.2 Theories

MIKS 17 January 2017

© R.J. Wieringa

113

Scientific theories

- A scientific theory is a belief about patterns in phenomena that has
 - been validated against experience
 - survived criticism by critical peers
- **Examples**
 - Theory of classical mechanics
 - Theory of evolution
 - Theory of cognitive dissonance
- **Non-examples**
 - Theory that the gods were astronauts
 - Conspiracy theories about who killed president Kennedy
 - The belief that my thoughts are monitored by aliens

MIKS 17 January 2017

© R.J. Wieringa

114

Problem theories

- Scientific theory of a problem
 - beliefs about problem patterns that have been validated against experience and survived critical analysis by peers
- *Ucare project: Design a system that provides health care support for elderly people at home.*
- **Problem theory:**
 - People stay home till a higher age than previously
 - Travelling to health care centers is unpleasant
 - Health care personnel is expensive and is overburdened
 - Health care budgets grow at unsustainable rate
 - ...

MIKS 17 January 2017 © R.J. Wieringa 115

Satellite TV reception system for a car, contains an antenna array. Problem to be solved by a software system: recognize direction of arrival of plane waves.

Problem theory:

- Definitions of concepts: Plane waves, wave length, bandwidth, etc.
- Generalization about the problem: $\phi = 2\pi (d/\lambda) \sin \theta$

MIKS 17 January 2017 © R.J. Wieringa

5.3 Research Methods

MIKS 17 January 2017 © R.J. Wieringa 117

- The goal of empirical research is to develop, test, refine change, or otherwise **update** scientific theories

MIKS 17 January 2017 © R.J. Wieringa 118

Kinds of empirical research methods

	Experimental study (treatment)	Observational study (no treatment)
Sample-based: investigate samples drawn from a population, look at averages and variation, infer population parameters	<ul style="list-style-type: none"> • Statistical difference-making experiment 	Survey
Case-based: investigate cases one by one, observe case architecture and at interaction mechanisms among components	<ul style="list-style-type: none"> • Expert opinion • Mechanism experiments • Technical action research 	Observational case study

- The methods in **bold** are useful for Problem research

MIKS 17 January 2017 © R.J. Wieringa 119

The empirical research setup

MIKS 17 January 2017 © R.J. Wieringa 120

Survey research

- **Surveys** of instances of the problem (large sample)
 - Survey of the use of role-based access control in large companies
 - Survey of the use of agile development methods in small and medium-sized companies
- Useful to describe statistical regularities (descriptive statistics, mean, variance, correlations) in classes of problems.

MIKS 17 January 2017 © R.J. Wieringa 121

Observational case studies

- **Observational case study** of instances of an implementation or problem:
 - Case study of problems with effort estimation of project managers in one company
 - Field study of the behavior of elderly at home
- Useful to describe implementations and problems in detail, and understand the mechanics and reasons behind their effects.

MIKS 17 January 2017 © R.J. Wieringa 122

Single-case mechanism experiments

- In a **single-case mechanism experiment**, we test a social or technical system
 - Observing elderly at home
 - Penetration-testing the security of existing systems
- Useful to describe the behavior of implemented technology, and to understand this in terms of underlying mechanisms

MIKS 17 January 2017 © R.J. Wieringa 123

Statistical difference-making experiments

- In **statistical difference-making experiments**, we investigate whether in a sample, a difference in an independent variable X makes a statistical difference to a dependent variable Y.
 - Apply several input scenarios to a company network and compare average behavior in scenarios with and without these inputs
 - Treatment group/control group experiment with software engineers to test their comprehension of UML diagrams

MIKS 17 January 2017 © R.J. Wieringa 124

Main points chapter 5

Implementation evaluation & problem investigation

- Implementation evaluation and problem investigation have different research goals but the same research questions.
 - Who are the stakeholders? What are their goals?
 - What conceptual framework shall we use to describe the phenomena?
 - What are the phenomena? Their causes, mechanisms, reasons?
 - What if we do nothing? How good/bad wrt goals?
- Useful research methods are
 - surveys,
 - observational case studies,
 - single-case mechanism experiments and
 - statistical difference-making experiments

MIKS 17 January 2017 © R.J. Wieringa 125

Assignment chapter 5

- Drenthen (2014) - *Towards continuous delivery in system integration projects*
 - Artifact is a continuous delivery method using an automated test tool.
 - Context is the delivery of identity solutions by Everett.
- Schoutsen (2012) - *Fraud detection within Medicaid*
 - Artifact: data warehouse
 - Context: fraud detection within Medicaid
- Van der Graaf (2012) - *EPR in Dutch hospitals-a decade of changes*
 - Artifact: EPRs
 - Context: Dutch hospitals
- [Page 15 in Q&A](#)

MIKS 17 January 2017 © R.J. Wieringa 126

Exercise

- What concepts do you need to describe your problem domain?
- What problematic phenomena are happening in the problem domain? Why is this happening? (Causes, reasons, and mechanisms behind these phenomena)
- What happens if nothing changes? How does this contribute (positively or negatively) to the stakeholder goals?

MIKS 17 January 2017 © R.J. Wieringa 127

Discuss these questions

- Chapter 4 2(c)
- Chapter 5 questions 6, 7

MIKS 17 January 2017 © R.J. Wieringa 128

6. Requirements Specification

MIKS 17 January 2017 © R.J. Wieringa 129

Engineering cycle

! = Action
? = Knowledge question

Treatment implementation

Implementation evaluation = Problem investigation

- Stakeholders? Goals?
- Conceptual problem framework?
- Phenomena? Causes, mechanisms, reasons?
- Effects? Positive/negative goal contribution?

Treatment validation

- Context & Artifact → Effects?
- Effects satisfy Requirements?
- Trade-offs for different artifacts?
- Sensitivity for different Contexts?

Treatment design

*Specify requirements!
 *Requirements contribute to goals?
 *Available treatments?
 *Design new ones!

MIKS 17 January 2017 © R.J. Wieringa 130

6.1 Requirements

MIKS 17 January 2017 © R.J. Wieringa 131

- **Requirements** are desired properties of the treatment
 - Stakeholder goals are what the stakeholder wants to achieve
 - Requirements are what the developer must achieve
 - Special kind of goal
- Sometimes, **constraints** on the internal composition of the artifact are distinguished from requirements on the externally observable properties of an artifact.
 - E.g. a constraint to reuse some components

MIKS 17 January 2017 © R.J. Wieringa 132

- Requirements cannot be just “elicited” from stakeholders
 - We do not know what we want
- Research projects may have very vague requirements
 - See if you can do this (existence proof)
 - See if you can do this better (e.g. better execution time)

MIKS 17 January 2017 © R.J. Wieringa 133

6.2 Contribution arguments

MIKS 17 January 2017 © R.J. Wieringa 134

Assumptions, requirements, goals

Assumptions C
about the context

External stakeholder goals G

Artifact requirements R

Should satisfy

↑

Should contribute to

↑

Should satisfy

↑

Problem context

Interaction X

Artifact

MIKS 17 January 2017 © R.J. Wieringa 135

Example

- *Ucare contribution argument*
 - (assumptions about patient behavior & desires, IT infrastructure of home for the elderly, national communication infrastructure, third-party services) AND
 - (requirements on mobile health care support technology) IMPLY
 - (reduce health care cost, improved health service)
- We need to evaluate systems **after** transfer to practice to see if this argument is correct!

MIKS 17 January 2017 © R.J. Wieringa 136

6.3 Kinds of requirements

MIKS 17 January 2017 © R.J. Wieringa 137

Classifications of requirements

- By stakeholder (Who wants it? Whose goals are served by it?)
- By priority (How strong is the desire?)
- By urgency (How soon must it be available?)
- By aspect (What is the requirement about? Which property?)

MIKS 17 January 2017 © R.J. Wieringa 138

Requirements by aspect (ISO 9126)

- A **function** is a terminating part of the interaction that provides a service to some stakeholder
- **Quality properties** (a.k.a. “nonfunctional properties”)
 - Utility (“suitability”)
 - Accuracy
 - Interoperability
 - Security
 - Compliance
 - Reliability
 - Usability
 - Efficiency (time or space)
 - Maintainability
 - Portability

- These are properties of functions
- They usually have global implications for artifact components and architecture

MIKS 17 January 2017 © R.J. Wieringa 139

Example

- **Ucare**
 - **Functions**
 - *Medicine dispensing*
 - *Blood pressure monitoring*
 - *Agenda*
 - *Remote medical advice*
 - **Quality:**
 - *Usable by elderly and medical personnel*
 - *Reliable*
 - *Safe*
 - *Cheap*

Classify this:

- By stakeholder
- By priority
- By urgency

MIKS 17 January 2017 © R.J. Wieringa 140

6.3 Indicators and norms

MIKS 17 January 2017 © R.J. Wieringa 141

Operationalization

- Some properties cannot be measured directly
 - *Usability, maintainability, security, ...*
- **Operationalize** them:
 - Define them in terms of one or more indicators that *can* be measured
- An **indicator** is a variable that can be measured
 - In software engineering, often called a **metric**.

MIKS 17 January 2017 © R.J. Wieringa 142

Some examples of indicators

- *Utility indicator: Opinion of stakeholder about utility*
- *Accuracy indicator: domain dependent, e.g. spatial resolution*
- *Interoperability indicator: effort to realize interface with a system*
- *Security indicators: availability, compliance to standards*
- *Compliance indicator: expert opinion about compliance*
- *Reliability indicators: mean time between failure, time to recover*
- *Usability indicators: effort to learn, effort to use*
- *Efficiency (time or space) indicators: execution time, disk usage*
- *Maintainability indicators: effort to find bugs, effort to repair, effort to test*
- *Portability indicators: effort to adapt to new environment, effort to install, conformance to standards*

See also http://en.wikipedia.org/wiki/Software_quality#Measurement

MIKS 17 January 2017 © R.J. Wieringa 143

Norms

- Once we have defined indicators (“metrics”), we can operationalize requirements by means of norms
- A **norm** is a desired range of values of an indicator
 - *Average effort to learn (indicator) is less than 30 minutes (norm)*
 - *Accuracy (indicator) is better than 1 degree (norm)*
 - *Function F (indicator) must be present (norm)*
 - *When it is time to dispense a medicine, the dispenser sends an alert to the ipad*
 - *If dispensing button is pushed, the dispenser releases medicine according to protocol defined for the patient*

MIKS 17 January 2017 © R.J. Wieringa 144

Informally stated requirement

Indicator satisfies norm Indicator satisfies norm

- Informally stated requirements may be operationalized into a set of indicator/norm pairs

MIKS 17 January 2017 © R.J. Wieringa 145

Main points chapter 6 Requirements specification

- Requirements** are desired properties of a treatment for which there is a stakeholder budget
- Must be motivated by **contribution argument**
 - (context assumptions) X (artifact requirements) contribute to (Stakeholder goals)
- Requirements can be classified according to **stakeholder goal, priority, urgency**
- Functional requirements** are desired functions
- Nonfunctional requirements** (quality properties)
 - Accuracy, efficiency, security, reliability, usability, ...
- Requirements may have to be operationalized
 - Indicator** is measurable variable: measurable property
 - Norm** is desired range of values of an indicator: measurable requirement

MIKS 17 January 2017 © R.J. Wieringa 146

Exercise

- What are the requirements for a solution to your design problem?
- Classify the requirements
 - By stakeholder
 - By priority
 - By urgency
 - By aspect

MIKS 17 January 2017 © R.J. Wieringa 147

7 Treatment Validation

MIKS 17 January 2017 © R.J. Wieringa 148

! = Action
? = Knowledge question

Engineering cycle

Treatment implementation

Treatment validation

- Context & Artifact → Effects? Why?
- Trade-offs for different artifacts? Why?
- Sensitivity for different Contexts? Why?
- Effects satisfy Requirements? Why?

Implementation evaluation = Problem investigation

- Stakeholders? Goals?
- Conceptual problem framework?
- Phenomena?
 - Causes, mechanisms, reasons?
 - Effects?
 - Positive/negative goal contribution?

Treatment design

- Specify requirements!
- Requirements contribute to goals?
- Available treatments?
- Design new ones!

MIKS 17 January 2017 © R.J. Wieringa 149

7.1 The validation research goal

MIKS 17 January 2017 © R.J. Wieringa 150

- Validation research questions are the same as implementation evaluation questions
 - But the goal is to validate new technology,
 - Not to evaluate implemented technology
- We find the validation research questions by analyzing treatment requirements (next slide)

MIKS 17 January 2017 © R.J. Wieringa 151

Engineering cycle

! = Action
? = Knowledge question

Treatment implementation

Implementation evaluation = Problem investigation

- Stakeholders? Goals?
- Conceptual problem framework?
- Phenomena?
- Causes, mechanisms, reasons?
- Effects?
- Positive/negative goal contribution?

Treatment validation

- Context & Artifact → Effects? Why?
- Trade-offs for different artifacts? Why?
- Sensitivity for different Contexts? Why?
- Effects satisfy Requirements? Why?

Treatment design

- Specify requirements!
- Requirements contribute to goals?
- Available treatments?
- Design new ones!

MIKS 17 January 2017 © R.J. Wieringa 152

Ucare requirements

- Functions
 - Medicine dispensing
 - Blood pressure monitoring
 - Agenda
 - Remote medical advice
- Usable by elderly and medical personnel
- Reliable
- Safe
- Cheap

Validation research questions

- Does it work?
 - Functions
 - Does it perform the medicine dispensing functions?
 - Does it perform the blood pressure monitoring functions?
 - Etc.
 - Is it usable by elderly and medical personnel?
 - Is it reliable?
 - Is it safe?
 - Is it cheap?
- What if we change the design?
- What if we vary the context?

To get answerable research questions, we need to operationalize the requirements!

MIKS 17 January 2017 © R.J. Wieringa 153

7.2 Validation models

MIKS 17 January 2017 © R.J. Wieringa 154

The fundamental problem of validation

- We investigate the artifact outside its natural implementation context
- The artifact has not been implemented yet.
 - It has not been transferred to the real-world problem context yet
- So we study it in the lab
- Or we do a pilot study in the real world

These are more or less realistic models of a real-world implementation

MIKS 17 January 2017 © R.J. Wieringa 155

Validation models

Model of the artifact

Representation

Artifact

Model of problem context (systems, stakeholders)

Problem context (systems, stakeholders)

Fig 7.2

MIKS 17 January 2017 © R.J. Wieringa 156

What is a model?

- An **analogic model** is an entity that represents entities of interest, called its **targets**,
- in such a way that questions about the target can be answered by studying the model.
- Examples
 - http://en.wikipedia.org/wiki/MONIAC_Computer
 - http://en.wikipedia.org/wiki/Scale_model
 - http://en.wikipedia.org/wiki/Miniature_wargaming
 - <http://en.wikipedia.org/wiki/Simulation>

MIKS 17 January 2017

© R.J. Wieringa

157

Example validation models

- *A software prototype interacting with a simulated environment*
- *A class of students using a new software engineering method in a project that simulates a real-world project*
- *A researcher using an experimental method to solve a real-world problem*
- *Ucare*
 - *Nurses imagining how the system would function*
 - *Elderly using a prototype in their home*

MIKS 17 January 2017

© R.J. Wieringa

158

Similarity

- How reliable is the generalization from the validation models to the real-world implementations?
- Positive analogy: Properties known to be similar
 - Should support transfer of conclusions about the model to conclusions about the target
- Negative analogy: Properties known to be different
 - Should block the transfer of some conclusions

MIKS 17 January 2017

© R.J. Wieringa

159

7.3 Design theories

MIKS 17 January 2017

© R.J. Wieringa

160

Design theories

- Design theory = a belief that there is a pattern in the interaction between the artifact and the context, tested by experiment, critically analyzed by peers
- *Design theory of the Ucare system, developed based on field tests:*
 - *The system helps elderly take their medicine, but not necessarily on time*
 - *Elderly may not use the Ucare functions but love to use the Skype function of the ipad*
 - *To provide reliable service, service providers must align the details of their interfaces as well as their maintenance procedures*

MIKS 17 January 2017

© R.J. Wieringa

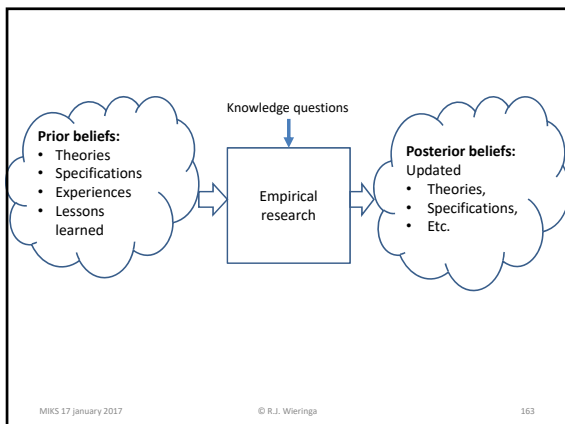

161

7.4 Research methods

MIKS 17 January 2017

© R.J. Wieringa

162

Kinds of empirical research methods

	Experimental study (treatment)	Observational study (no treatment)
Sample-based: investigate samples drawn from a population, look at averages and variation, infer population parameters	<ul style="list-style-type: none"> Statistical difference-making experiment 	Survey
Case-based: investigate cases one by one, observe case architecture and at interaction mechanisms among components	<ul style="list-style-type: none"> Expert opinion, Mechanism experiments, Technical action research 	Observational case study

• The methods in **bold** are useful for validation research

MIKS 17 January 2017 © R.J. Wieringa 164

Expert opinion

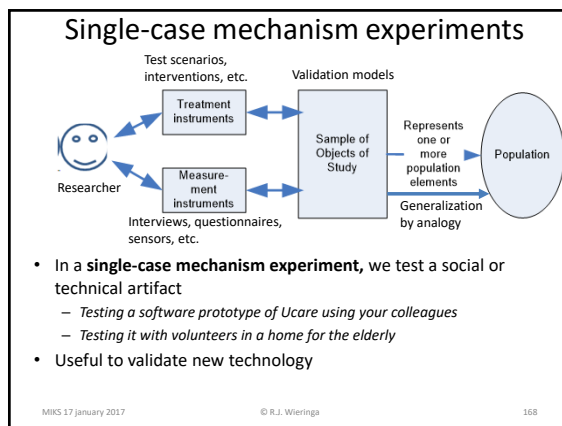

MIKS 17 January 2017 © R.J. Wieringa 165

Single-case mechanism experiments

(a.k.a. simulations)

MIKS 17 January 2017 © R.J. Wieringa 167

Technical action research

MIKS 17 January 2017 © R.J. Wieringa 169

Technical Action Research

- In Technical Action research, we test a social or technical artifact by using it for a real-world problem
 - *Experimental use of a new enterprise architecture method in a consultancy with a real-world client*
- Useful to validate new technology

MIKS 17 January 2017 © R.J. Wieringa 170

Statistical difference-making experiments

MIKS 17 January 2017 © R.J. Wieringa 171

Statistical difference-making experiments

- In **statistical difference-making experiments**, we investigate whether in a sample, a difference in an independent variable X makes a statistical difference to a dependent variable Y.
 - *Compare a new software engineering technique with an existing one in an experiment with two groups of students*
 - *Compare a new algorithm with an existing one by exposing them to a set of contexts to which they are randomly allocated*

MIKS 17 January 2017 © R.J. Wieringa 172

7.4 Scaling up

MIKS 17 January 2017 © R.J. Wieringa 173

Scaling up

Fig. 7.3

MIKS 17 January 2017 © R.J. Wieringa 174

Main points chapter 7 Treatment validation

- Validation is a prediction problem
 - What would be the effect of artifact in context?
 - Trade-offs in design of artifact?
 - Sensitivity to changes in context?
 - Satisfaction of requirements?
- Use validation models to build a design theory of $A \times C$;
- Then use design theory to do predictions
- Research methods
 - Expert opinion
 - Single-case mechanism experiments
 - Statistical difference-making experiments
 - Technical action research
- Scale up from idealized to practical conditions

MIKS 17 January 2017

© R.J. Wieringa

175

Exercise

- What artifact needs to be designed to treat your design problem?
- What are the validation research questions for this artifact?
 - Effect, trade-off, sensitivity, requirements satisfaction questions
- How will you investigate these questions?
 - Assume that you have enough time and money to do all research needed

MIKS 17 January 2017

© R.J. Wieringa

176

Assignment for 21 february

- Make a poster for your research project
 - The context, the problem to be solved
 - Your research goal
 - Top-level design problem (following the template)
 - Subproblems and knowledge questions
- Table of contents

MIKS 17 January 2017
